DEPARTMENT OF INFORMATION SCIENCE & ENGINEERING

CERTIFICATE

This is to certify that the Mini Project entitled **"ONLINE SHOPPING SYSTEM"** has been successfully completed by

AMARJIT YANGLEM	**4AL18IS003**
RANJAN KUMAR	**4AL18IS019**

The bonafide students of **Department of Information Science & Engineering, Alva's Institute of Engineering and Technology** in **DEPARTMENT OF INFORMATION SCIENCE & ENGINEERING** of the **VISVESVARAYA TECHNOLOGICAL UNIVERSITY, BELAGAVI** during the year 2020–2021. It is certified that all corrections/suggestions indicated for Internal Assessment have been incorporated in the report deposited in the departmental library. The Mini project report has been approved as it satisfies the academic requirements in respect of Mini Project work prescribed for the Bachelor of Engineering Degree.

Mr. JAYANTH KUMAR RATHOD **Associate Professor**	**Mr. SUDHEER SHETTY**
Mini Project Guide	**HOD ISE**

Declaration

We,

AMARJIT Y

RANAJAN KUMAR

hereby declare that the dissertation entitled, **ONLINE SHOPPING SYSTEM** is completed and written by us under the supervision of my guide **Mr. Jayanth Kumar Rathod, Associate Professor, Department of Information Science and Engineering, Alva's Institute of Engineering And Technology, Moodbidri , DEPARTMENT OF INFORMATION SCIENCE & ENGINEERING** of the **VISVESVARAYA TECHNOLOGICAL UNIVERSITY, BELAGAVI** during the academic year 2020-2021.The dissertation report is original and it has not been submitted for any other degree in any university.

AMARJIT YANGLEM	**4AL18IS003**
RANJAN KUMAR	**4AL18IS019**

ACKNOWLEDGEMENT

The satisfaction and euphoria that accompany a successful completion of any task would be incomplete without the mention of people who made it possible, success is the epitome of hard work and perseverance, but steadfast of all is encouraging guidance.

So, with gratitude we acknowledge all those whose guidance and encouragement served as beacon of light and crowned the effort with success.

The selection of this mini project work as well as the timely completion is mainly due to the interest and persuasion of our mini project guide **Mr. Jayant Kumar Rathod,** Associate Professor, Department of Information Science & Engineering. We will remember his contribution forever.

We sincerely thank, **Mr. Sudheer Shetty** Professor and Head, Department of Information Science & Engineering who has been the constant driving force behind the completion of the project.

We thank our beloved Principal **Dr. Peter Fernandes,** for his constant help and support throughout.

We are indebted to **Management of Alva's Institute of Engineering and Technology, Mijar, Moodbidri** for providing an environment which helped us in completing our mini project.

Also, we thank all the teaching and non-teaching staff of Department of Information Science & Engineering for the help rendered.

AMARJIT YANGLEM 4AL18IS003

RANJAN KUMAR 4AL18IS019

ABSTRACT

Online Shopping System is a computerized system used to store and retrieve information and conduct transactions related to online products. The project is aimed at exposing the relevance and importance of Online Shopping Systems. It is projected towards enhancing the relationship between customers and product sellers through the use of online shopping system, and thereby making it convenient for the customers to purchase products as when they require such that they can utilize this software to order their products.

This software has two parts. First is user part and the administrator part. User part is used as a frontend and administrator is the back end. Administrator is used by the website developers. It will allow the customers to access database and allow new customers to reserve for online access. The system allows the customers order the products online, according to their desire the products has been classified into categories namely, products for men, women and children. The system displays all the product details such as name, price and type of category it belongs as they would like to do for e.g.: casual, jeans, kurtas, sandals, etc.

If shops are providing an online portal where their customers can enjoy easy shopping from anywhere, the shops won't be losing any more customers to the trending online shops such as flip cart or eBay. Since the application is available in the Smartphone it is easily accessible and always available.

CHAPTER 1

INTRODUCTION

1.1 INTRODUCTION

Shopping will be one of the crazes that most of the people will be having in this world. Some people will have shopping as a hobby. People buy stuffs from place to place through different shops and shopping malls. If you're buying through the different then there arises this concept of desired product that one needs to search from shop to shop. The Online Shopping system will help in managing the tickets in a well-organized manner.

Through this Online Shopping system, it will be helpful for those who want to order their products through our website which also provides various discounts and offers during every season.

1.2 PROBLEM STATEMENT

In few places if a person wants to order a product, they used to Manually go to the store and buy it, personally going to a place, and finding the right shop, picking the right product and purchasing it requires a lot of time and in some cases people would return empty handed, plus travelling cost is also a factor to the issue.

Online Shopping System make the life of people very easy as they don't need to go through the process of personally buying stuffs as they can easily make orders of product online just from a single system. On the other hand, it also increases a products value in the market thereby increasing the socio-economy through the help of internet.

With the help of this system, customers can view all the different products' availability based on the type of products they want, it also allows them to order a product, cancel an order or return it.

1.3 MOTIVATION AND OBJECTIVE OF THE PROJECT

The main objective of the online shopping system is to manage the details of products, customers, product-demand, product availability. The project is totally built at administrative end and thus only the administrator is guaranteed the access. The purpose of the project is to build an application program to reduce the manual work for going through the search for the desired product. It tracks all details about the products.

1.4 PROPOSED SOLUTIONS AND ADVANTAGES

The online shopping system that we are Proposing ensures the gives total freedom for customers, where customers can use his own personal computer to log on the website and can order their products. The online shopping system allows only registered users or passengers to place an order for the products. The online shopping system will work online and ticket with some transaction id is also generated for passengers as a print document.

It is flexible for the user as the system is very easy and no technical knowledge is required to use the system. Through this Online Shopping system, it will be helpful for those who want to order their products through our website which also provides various discounts and offers during every seasons. The Online Shopping system will help in managing the products in a well-organized manner. With the help of this system, customers can order a product, cancel an order or return it. It also makes the life of the online sellers easier by keeping all the records of the products and if there is any demands in the products, the seller are promptly informed. This system is also used by companies to keep track of customer preferences of regular purchased products so that they can provide better service and give offers to customers.

CHAPTER 2

SYSTEM DESIGN

2.1 SCHEMA DIAGRAM

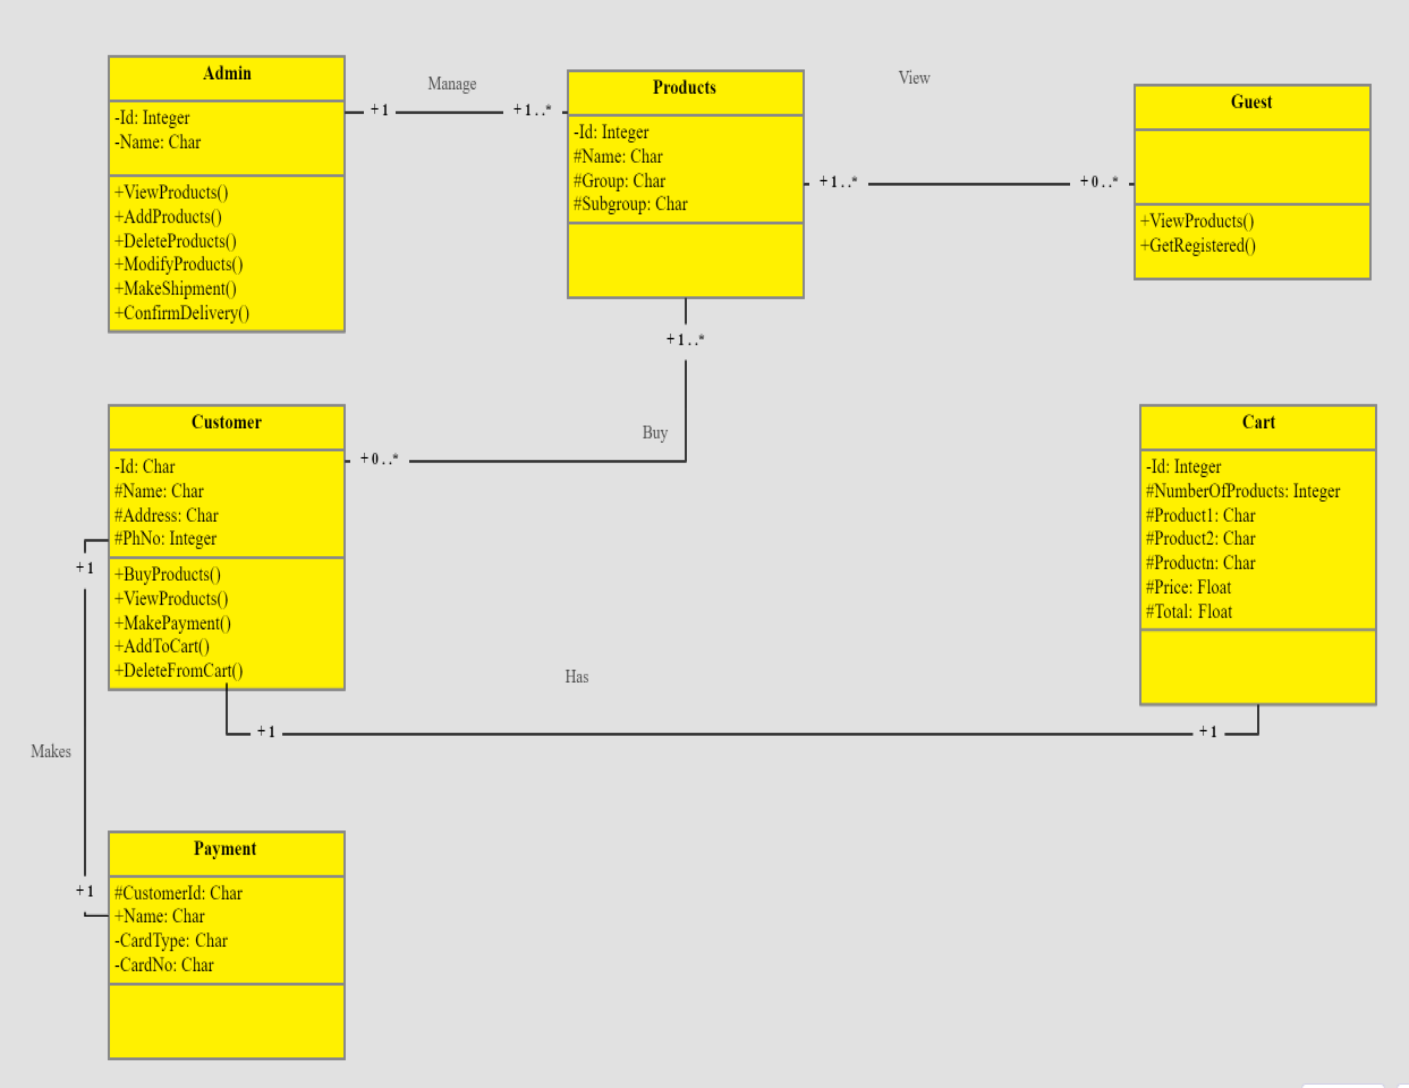

Figure 2.1 Schema Diagram

The Figure 2.1 is the schema diagram for Online Shopping System. It shows the relationship between different table attributes.

2.2 ER DIAGRAM

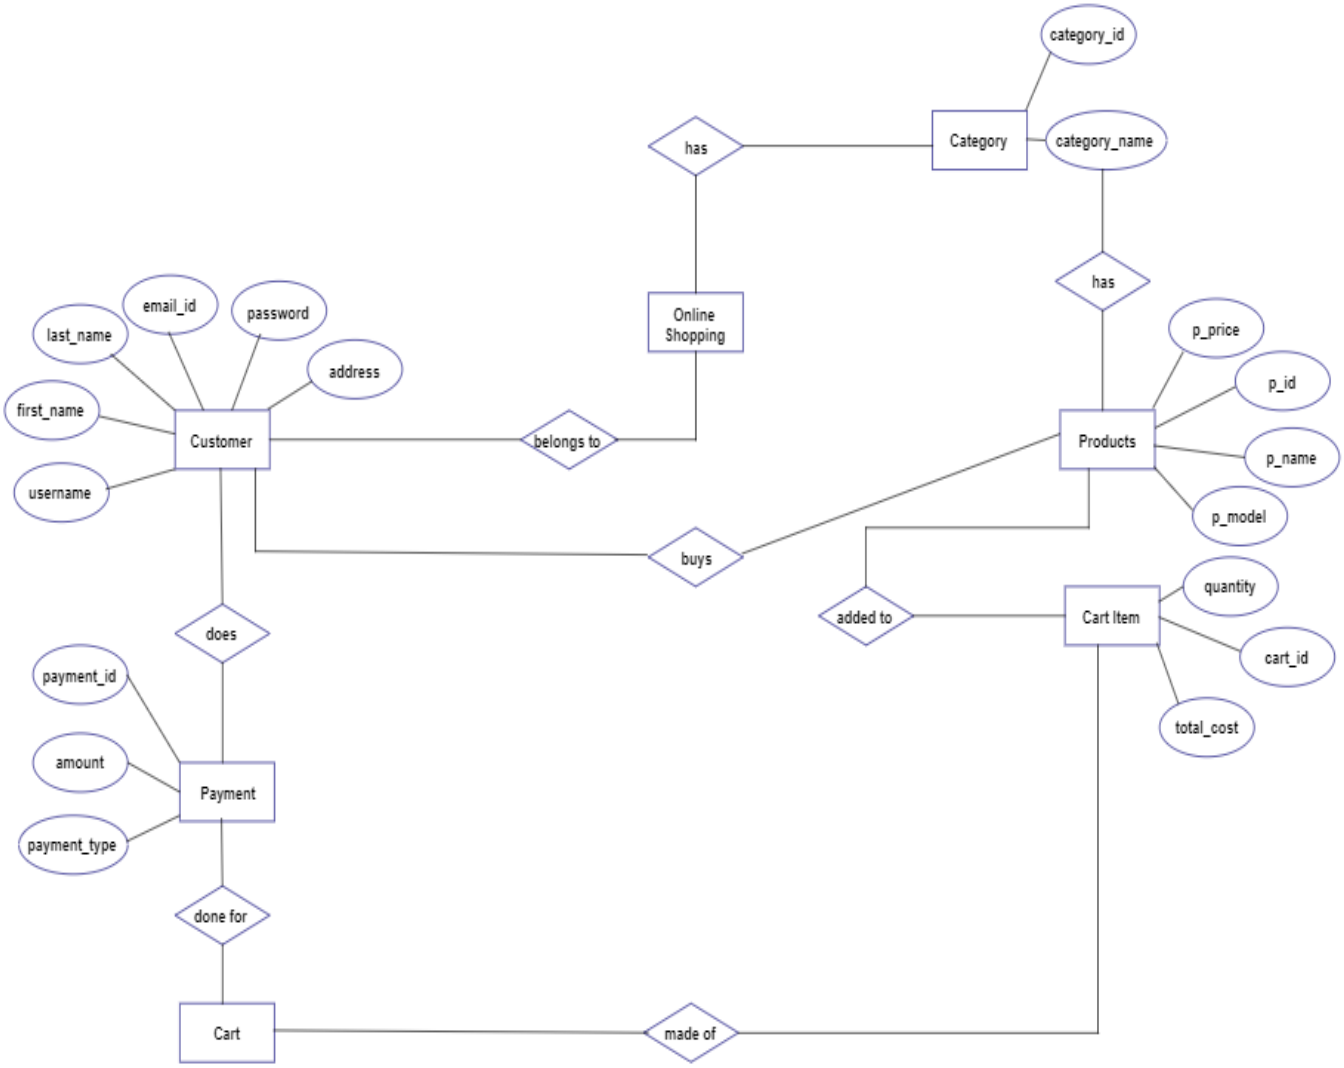

Figure 2.2 ER Diagram

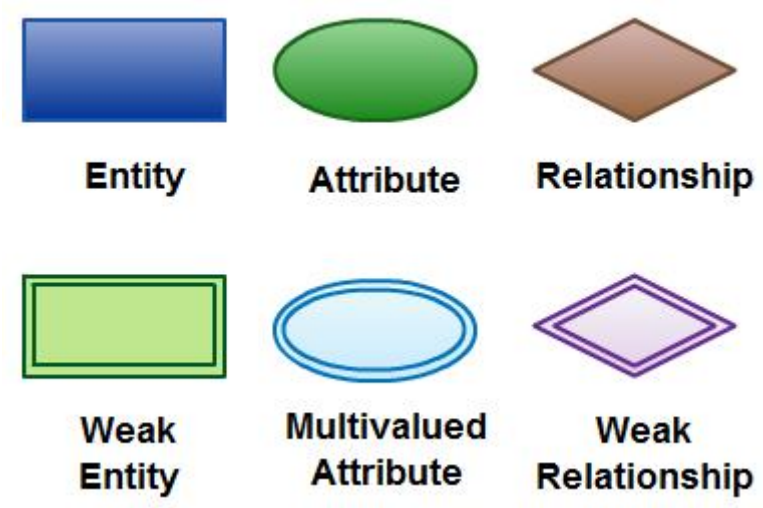
2.3 ENTITY-RELATIONSHIP MODEL

ER Model stands for Entity Relationship Model which is a high-level conceptual data model Diagram. An Entity-Relationship Model (ER Model) describes interrelated things of interest in a specific domain of knowledge. A basic ER model is composed of entity types (which classify the things of interest) and specifies relationships that can exist between entities (instances of those entity types). An ER Model is commonly formed to represent things a business needs to remember in order to perform business processes.

Consequently, the ER model becomes an abstract data model, that defines a data or information structure which can be implemented in a database, typically a relational database. The ER Model represents real-world entities and the Relationships between them. Creating an ER Model in DBMS is considered as a best Practice before implementing your database.



Followings are the main components and its symbols in ER Diagram:

- **Rectangles:** This Entity Relationship Diagram symbol represents entity types.
- **Ellipses:** This symbol represents attributes.
- **Diamonds:** This symbol represents relationship types.
- **Lines:** It links attributes to entity types with other relationship types.
- **Primary Key:** Attributes are underlined.
- **Double Ellipses:** Represents multi-valued attributes.

CHAPTER 3
IMPLEMENTATION

In this chapter the implementation details of the project have been specified.

3.1 HARDWARE SPECIFICATIONS:

- 40 GB hard disk space.
- 4 GB RAM.
- Network Connectivity.

3.2 SOFTWARE SPECIFICATIONS:

- Windows(x64) Operating System.
- Visual Studio Code.
- MySQL Server.
- Apache Server.
- Xampp.

3.2.1 LANGUAGE USED FOR IMPLEMENTATION

The languages used for implementation are as follows:

- Front end: - PHP, HTML
- Back end: - MySQL

PHP: -

PHP is a server-side scripting language designed primarily for web development but also used as a general-purpose programming language. Originally created by Rasmus Lerdorf in 1994, the PHP reference implementation is now produced by The PHP Development Team. PHP originally stood for Personal Home Page, but it now stands for the recursive acronym.

PHP code may be embedded into HTML or HTML5 mark up, or it can be used in combination with various web template systems, web content management systems and web frameworks. PHP code is usually processed by a PHP interpreter implemented as a module in the web server or as a Common Gateway Interface (CGI) executable. The web server software combines the results of the interpreted and executed PHP code, which may be any type of data, including images, with the generated web page. PHP code may

also be executed with a command-line interface (CLI) and can be used to implement standalone graphical.

HTML: -

Hypertext Mark-up Language (HTML) is the standard mark-up language for creating web pages and web applications. With Cascading Style Sheets (CSS) and JavaScript it forms a triad of cornerstone technologies for the World Wide Web. Web browsers receive HTML documents from a web server or from local storage and render them into multimedia web pages.

MySQL: -

MySQL is an open-source relational database management system(RDBMS). Its name is a combination of "My", the name of co-founder Michael Widenius' daughter, and "SQL", the abbreviation for Structured Query Language. The MySQL development project has made its source code available under the terms of the GNU General Public License, as well as under a variety of proprietary agreements. MySQL was owned and sponsored by a single for-profit firm, the Swedish company MySQL AB, now owned by Oracle Corporation. For proprietary use, several paid editions are available, and offer additional functionality.

3.2.2 PLATFORM USED FOR IMPLEMENTATION

XAMPP

XAMPP is a free and open source cross-platform web server solution stack package developed by Apache Friends, consisting mainly of the HTTP Server, MariaDB database, and interpreters for scripts written in the PHP and Perl programming languages. XAMPP stands for

Cross-Platform (X), Apache (A), MariaDB (M), PHP (P) and Perl (P). It is a simple, lightweight Apache distribution that makes it extremely easy for developers to create a local web server for testing and deployment purposes. Everything needed to set up a web server – server application (Apache), database (MariaDB), and scripting language (PHP) – is included in an extractable file. Online Shopping System

XAMPP is also cross-platform, which means it works equally well on Linux, Mac and Windows. Since most actual web server deployments use the same components as XAMPP, it makes transitioning from a local test server to a live server extremely easy as well.

PhpMyAdmin

PhpMyAdmin is a free and open source administration tool for MySQL and MariaDB. As a portable web application written primarily in PHP, it has become one of the most popular MySQL administration tools, especially for web hosting services.

3.3 SQL DATA DICTIONARY

The Data Dictionary used for creating these tables are as follow:

- CATEGORY

Column	Type	Null	Default	Links to	Comments	Media (MIME) type
cat_id	varchar(30)	No				
category	varchar(50)	No				

- DETAILS

Column	Type	Null	Default	Links to	Comments	Media (MIME) type
name	varchar(30)	No				
pass	varchar(30)	No				

- FBDK

Column	Type	Null	Default	Links to	Comments	Media (MIME) type
contact_id *(Primary)*	int(10)	No				
name	varchar(30)	No				
phone no	varchar(30)	No				
email	varchar(30)	No				
subj	varchar(30)	No				
mesg	varchar(30)	No				

- STATUS

Column	Type	Null	Default	Links to	Comments	Media (MIME) type
item_id *(Primary)*	int(10)	No				
catg	varchar(40)	No				
subcatg	varchar(40)	No				
img	varchar(30)	No				
itemno	varchar(30)	No				
price	varchar(30)	No				
desc	varchar(300)	No				
info	varchar(500)	No				
dat	varchar(100)	No				

- ORDERS

Column	Type	Null	Default	Links to	Comments	Media (MIME) type
pname	varchar(30)	No				
itemno	varchar(30)	No				
price	varchar(30)	No				
size	varchar(30)	No				
uname	varchar(30)	No				
ac_no	varchar(30)	No				
mob_no	varchar(30)	No				
add	varchar(300)	No				
bank	varchar(30)	No				
city	varchar(30)	No				
order_no	varchar(30)	No				

- REGISTER

Column	Type	Null	Default	Links to	Comments	Media (MIME) type
user_id *(Primary)*	int(10)	No				
title	varchar(6)	No				
fname	varchar(30)	No				
lname	varchar(30)	No				
gen	varchar(30)	No				
id	varchar(50)	No				
pass	varchar(30)	No				
phone	varchar(20)	No				
add	varchar(300)	No				
city	varchar(30)	No				
coun	varchar(30)	No				
dob	varchar(30)	No				

- SUBCATEGORY

Column	Type	Null	Default	Links to	Comments	Media (MIME) type
subcat_id *(Primary)*	int(10)	No				
cat_id	varchar(30)	No				
subcategory	varchar(50)	No				

- TRASH

Column	Type	Null	Default	Links to	Comments	Media (MIME) type
catg	varchar(50)	No				
subcatg	varchar(50)	No				
img	varchar(60)	No				
itemno	varchar(30)	No				
price	int(30)	No				
desc	varchar(300)	No				
dat	varchar(30)	No				

3.4 OUTPUT TESTING

- While executing php MySQL connection code we were not able to make the connection of backend MySQL to front end php. So, to solve this problem we had to create a new MySQL user with password. After this the connection was successful.
- The connection was successful but the data entered in front end was not storing in backend, since all the attributes data types in backend were not set to varchar. So, we modified the php code and MySQL query accordingly.
- If we enter wrong password, local host says wrong password. If XAMP server is not started, then we cannot run local host.

CHAPTER 4

RESULTS

CHAPTER 5

CONCLUSION AND FUTURE ENHANCEMENT

In this chapter the project is concluded and its future enhancement has been specified.

5.1 CONCLUSION

The web based "Online Shopping System" project is just another attempt to stimulate the basic concepts of online shopping system. The system has been developed with much care and free of errors and at the same time it is efficient and less time consuming. The purpose of this project was to develop a web application and an android application for purchasing items from a shop.

This project helped us in gaining valuable information and practical knowledge on several topics like designing web pages using html & css, usage of responsive templates, designing of android applications, and management of database using mysql . The entire system is secured. Also the project helped us understanding about the development phases of a project and software development life cycle. We learned how to test different features of a project.

This project has given us great satisfaction in having designed an application which can be implemented to any nearby shops or branded shops selling various kinds of products by simple modifications.

5.2 FUTURE ENHANCEMENT

- This system can be updated as online system.
- Multi-user Interface can be added to this system.
- moderator more control over products so that each moderator can maintain their own products.
- providing classes for customers so that different offers can be given to each class.
- Keeping track of each purchases of each customer.
